

Is There Life After Death? Proposing a New Cosmology Beyond Death Science

In the realm of science and exploration, there are many questions that continue to intrigue and captivate the human mind. One of the most profound and mysterious of these questions is whether there is life after death. While the concept of an afterlife has been debated for centuries, recent advancements in scientific understanding and cosmology have rekindled interest in exploring this timeless inquiry. In this article, we will delve into the realm beyond death science and propose a new cosmology that challenges conventional beliefs.

The Limitations of Death Science

Death science, as it is commonly understood, refers to the scientific study of death and its immediate effects. This includes studying the physical processes and biological changes that occur in a body after death. While death science has provided valuable insights into mortality and the decomposition of the human body, it falls short when it comes to exploring the possibility of an afterlife.

Traditional death science operates within the boundaries of observable phenomena and measurable data. It focuses on the physical aspects of death, such as bodily functions ceasing, brain activity stopping, and the disintegration of organic matter. However, it fails to address the consciousness or the existence of an individual beyond death.

Conventional science often dismisses the concept of an afterlife as mere superstition or wishful thinking. It argues that consciousness is purely a product of brain activity and that once the brain dies, so does the person's identity and consciousness. While this viewpoint may appear logical, it overlooks the countless accounts of near-death experiences, past-life memories, and spiritual encounters that have been reported by individuals throughout history.

Expanding Our Understanding: A New Cosmology

Just as our understanding of the universe has evolved over time, so too should our exploration of life after death. It is time to propose a new cosmology that encompasses the possibility of consciousness transcending physical death.

This new cosmology challenges the reductionist view that consciousness is solely reliant on the physical brain. It suggests that consciousness is a fundamental aspect of the universe, existing independently of our physical bodies. According to this perspective, death is not an end but rather a transition from one state of existence to another.

The foundation of this new cosmology lies in quantum physics, which posits that reality is not fixed and deterministic but rather a collection of probabilities and potentialities. It suggests that consciousness, at its core, is an integral part of the fabric of the cosmos, interconnected with all phenomena and dimensions.

Furthermore, this proposed cosmology incorporates various spiritual and philosophical teachings that have offered glimpses into the nature of existence beyond death. Eastern philosophies, such as Hinduism and Buddhism, have long embraced the idea of reincarnation and the continuation of consciousness. Near-death experiences, where individuals report leaving their bodies and entering alternate realms, also provide compelling evidence for a realm beyond death science.

Implications and Future Research

If we are to consider this new cosmology seriously, it has significant implications for how we approach life and death. It challenges conventional notions of mortality, offering hope and comfort to those who fear the unknown. It also encourages a deeper exploration of consciousness and its role in shaping our reality.

While the proposed cosmology provides an alternative perspective, it is important to note that further research and investigation are necessary to test its validity. This requires a multidisciplinary approach, bringing together scientists, philosophers, and spiritual leaders to explore the intricacies of consciousness, quantum physics, and the nature of existence.

, the question of life after death continues to captivate and perplex humanity. By expanding our understanding through a new cosmology that encompasses consciousness beyond physical death, we open doors to new possibilities and

avenues of exploration. This proposal challenges the limitations of death science and invites us to embark on a journey towards unraveling the mysteries of existence beyond our mortal coil.

The second edition of Proposing a "New" Cosmology Beyond Death Science probes into how prominent theories of physical cosmology intermix with religious ideologies, especially New Age teachings, in their definitions of a cosmological origin. While science and religion tend to dismiss one another, they both commonly oversimplify an origin of creation as an all-in-one entity able to create an entire universe or cosmos from within itself as a respective "big bang."

As this is largely a conceptual book, it briefly explores the Big Bang theory, fractals, special and general relativity, M-theory, the Higgs boson and field, multiple dimensions and universes, and more in order to gain a basic but workable model of creation organizing the levels of interplay and similarity between waves, particles, and fields. This model extends to undiscovered or "new science" spaces of energy we can sense and somewhat understand when we explore beyond currently established boundaries.

Ultimately, or rather foundationally, this model arrives at the source before creation, which is not a zero-point or field because it does not contain any universal component. If we apply a loose correlation to our respective energies, this source is most similar to a nonreactive, pre-hydrogen-like, pre-gaseous essence. This distinct, pure essence is conscious, and it can extend its awareness to all living beings through the core aspect of our compositional templates and DNA.

The primary theme posits that living consciousness and eternal energy substances precede the creation of "death science" based on decay. Our immediate galaxy and universe are a struggling system that could not exist without an eternal foundation in a vast cosmology.
